

Thiothixene

Revised: November 30, 2022.

CASRN: 5591-45-7

Drug Levels and Effects

Summary of Use during Lactation

Because there is no published experience with thiothixene during breastfeeding, other antipsychotic agents are preferred.

Effects in Breastfed Infants

Relevant published information was not found as of the revision date.

Effects on Lactation and Breastmilk

Thiothixene has caused galactorrhea.[1] Hyperprolactinemia appears to be the cause of the galactorrhea.[2-4] The hyperprolactinemia is caused by the drug's dopamine-blocking action in the tuberoinfundibular pathway.[5] [5] The prolactin level in a mother with established lactation may not affect her ability to breastfeed.

Alternate Drugs to Consider

Haloperidol, Olanzapine, Quetiapine, Risperidone
