

## Calcipotriene

Revised: December 3, 2018.

CASRN: 112965-21-6

## Drug Levels and Effects

### Summary of Use during Lactation

No information is available on the use of calcipotriene during breastfeeding. Because it is poorly absorbed after topical application, calcipotriene is probably a low risk to the nursing infant and is generally considered acceptable during breastfeeding, even to the nipple area.[1-5] Avoid application of the combination product containing betamethasone (Enstilar) to the breast. Only water-miscible cream or gel products should be applied to the breast because ointments may expose the infant to high levels of mineral paraffins via licking.[6]
