Drug Levels and Effects

Summary of Use during Lactation

Inmazed is a mixture of monoclonal antibodies, atoltivimab, maftivimab, and odesivimab that are directed against *Zaire ebolavirus* glycoprotein. No information is available on the use of Inmazed during breastfeeding. Because Inmazed is a mixture of large protein molecules with molecular weights of 144,000 to 146,000 Da, the amount in milk is likely to be very low and absorption is unlikely because the antibodies are probably destroyed in the infant's gastrointestinal tract. Until more data become available, Inmazed should be used with caution during breastfeeding, especially while nursing a newborn or preterm infant. The US Centers for Disease Control and Prevention recommend that patients with confirmed *Zaire ebolavirus* not breastfeed their infants to reduce the risk of postnatal transmission of *Zaire ebolavirus* infection.
